## Section -B

Q.2.(a). The manager of an oil refinery must decide on the optimum mix of two possible blending processes of which the input and output production runs are a follows.

| Process | Input |  | Output |  |
| :--- | :---: | :---: | :---: | :---: |
|  | Crude A | Crude B | Gasoline X | Gasoline Y |
| 1 | 6 | 4 | 6 | 9 |
| 2 | 5 | 6 | 5 | 5 |

The maximum amounts available of crude A and crude B are 250 units and 200 units respectively. Market demand shows that atleast 150 units of gasoline X and gasoline Y must be produced. The profits per production run from process 1 and process 2 are Rs. 4 and Rs. 5 respectively. Formulate the problem to maximize the profit.
(b) Write the mathematical formulation of transportation problem.
Q.3. Solve the following linear programming problem by simplex method.

$$
\begin{align*}

& x_{1}+2 x_{2}+2 x_{3}+4 x_{4} \leq 80 \\
& 2 x_{1}+2 x_{3+} x_{4} \leq 60 \\
& 3 x_{1}+3 x_{2}+x_{3}+x_{4} \leq 80 \\
